Annex 1 Data

Introduction

1 Switzerland is a small, economically prosperous country in central Europe which comprises 0.4% of the total surface area of Europe and is the source of 6% of the fresh water for the continent.

2 2 The Rhine, Rhone and their tributaries drain 86% of Switzerland into either the North-East Atlantic (Rhine) or the Mediterranean (Rhone).

3 4 Switzerland is a member of the OSPAR (Oslo – Paris) convention, the mechanism by which 15 Governments & the EU cooperate to protect the marine environment of the North-East Atlantic.

4 5 5 According to paragraph 10 of the OSPAR Agreement 2014-01 "The sources of marine litter are diverse and ocean dynamics turn it into a transboundary issue requiring collective action." Marine litter is defined in OSPAR agreement 2010-02:

"Marine litter (marine debris) is any persistent, manufactured or processed solid material discarded, disposed of, abandoned or lost in the marine and coastal environment. This also includes such items entering the marine environment via rivers, sewage outlets, storm water outlets or winds."

As a member of the OSPAR convention and a major source of the fresh water that ultimately drains into the Mediterranean and North Sea, Switzerland has a significant role and responsibility to make an effort to both quantify and limit the marine litter pollution in its' rivers, streams and lakes.

Switzerland, with a population of 8 million robust consumers promotes an image of technologic innovation and a clean litter free country. **However, litter survey's conducted along the shores of Lake Geneva over the last 16 months indicate the country is part of the problem rather than the solution.**

Additional surveys show the litter problem is not limited to Lake Geneva but is country wide. An antiquated drainage system and topography allows litter to be flushed primarily by rain water and snow melt run-off into the gutters and drains which flow into the streams and rivers. A visit to any alpine ski resort will show how the snow melt and rain is effectively used to continuously push the litter problems downstream and eventually across borders.

hammerdirt, somebody has to do it

The Data

The OSPAR convention defines an efficient and cost effective way to monitor marine litter accumulation on the shore line, OSPAR agreement 2010-02:

"The collection of data on marine beach litter provides information on amounts, trends and sources of marine litter. This information can be used to focus on effective mitigating measures and to test the effectiveness of existing legislation and regulations. The ultimate aim is that the amount of litter entering the marine environment is minimized."

The data collected is available for download and includes locations across continental Europe and the United Kingdom going back to 2001.

There is no data for Switzerland on the OSPAR database. However, there is one association, active in Switzerland that follows the model defined by OSPAR and Marine Litter Watch and makes the data available for download. **The hammerdirt association collects, counts and disposes of litter found on the shoreline of Lake Geneva**

Other organisations and projects that use similar methods to assess marine litter :

There are many other local and regional associations, contact us and we can help you find one near you.

The Methods

At hammerdirt the marine litter is reported in pieces/m² of shoreline and in the OSPAR method the litter is reported in pieces/100m of shoreline. This reflects a very important difference: the size of the survey area. Beaches on Lake Geneva are very small, rarely greater than 70 meters long and except in rare cases less than 15 meters wide (table 1).

Beach	Length in meters
baye_de_claren	72
montreuxrd	51
montreuxrg	67
pierrier	67
veveyse	48
L'Arabie	42

table 1: Length of swiss beaches

The authors do not intend to explain the details of the litter-survey methods. For a full description of the OSPAR method please consult OSPAR agreement 2010-02, for the hammerdirt method consult the current project plan available on the project website. Both methods count the individual pieces of litter in a defined area. The difference is the manner in which they are reported.

In order to compare the data, the totals were converted in pieces per linear meter of shoreline.

The Results

In total 263 litter surveys were compared representing 68 different beaches from 11 countries. Of the 263 surveys 236 were from the OSPAR database and 27 surveys from the hammer dirt project. The oldest survey is from 2 January 2014 and the most recent is from January 24, 2016.

With a litter density of 113 pcs/m "Ytre Hvaler" in Norway is the most polluted beach of the sites in the survey, "drains bay" at 0.1 pcs/m is the least polluted. Switzerland, at the Plage de l'Arabie in Vevey makes its first appearance on the list in the third position with 47.7 pcs/m (table 2).

Beaches on Lake Geneva occupy 13 positions in the top 100 polluted beaches of this survey (annex 1).

Country	Date	Beach	Pieces per meter
Norway	3/25/2014	Ytre Hvaler	113,2
France	4/23/2014	Koubou	90,2
CH	1/24/2016	Plage de L'Arabie	47,7
United Kingdom	1/24/2014	Ballyhornan	47,6
Norway	5/9/2014	Rekvika i Skulsfjord	40,6
Norway	10/1/2014	Rekvika i Skulsfjord	36,2
Portugal	1/15/2014	Osso da Baleia	36,2
Sweden	4/26/2014	Gröderhamn	30,5
France	3/27/2014	Trielen	24,2
United Kingdom	1/17/2014	White Park Bay	23,7

table 2: Top ten most polluted beaches by pieces per meter of shoreline

Country	Surveys	Pieces per survey	Average pieces per meter	Number of beaches
Norway	5	3831	38,3	3
France	21	1058	10,6	7
Sweden	18	690	6,9	6
Switzerland	27	317	5,8	5
Portugal	37	525	5,3	9
United Kingdom	56	524	5,2	14
Netherlands	16	362	3,6	4
Spain	45	347	3,5	11
Belgium	7	155	1,6	2
Germany	14	147	1,5	4
Ireland	16	111	1,1	4

table 3: Results per country in descending order of average pieces per meter

When the pieces per meter of each country are averaged Switzerland is in the fourth position of the most polluted beaches (table 3). Note that even though Switzerland has less total pieces per survey than Portugal, the UK, the Netherlands and Spain it places higher in terms of pieces per meter of shoreline, a first indicator of density.

Density

The exposed shoreline of Lake Geneva is limited, therefore hamerdirt uses pieces per m² to determine density. This may give an initial impression of less material when compared to larger shorelines and total pieces per survey. A closer inspection of the data shows the shores of Lake Geneva have a greater concentration of litter in a smaller surface area(figure 1).

figure 1: example of density of litter versus total litter

Country	Beach name	Pieces per survey	Pieces per meter	Rank
CH	Pierrier	577	8,6	36
Portugal	Monte Velho	861	8,6	37
United Kingdom	Tyrella	855	8,6	38
United Kingdom	Ardglass	842	8,4	39
CH	Montreuxrd	422	8,3	40
Spain	Oyambre	821	8,2	41
United Kingdom	Tyrella	808	8,1	42
CH baye_de_claren		580	8,1	43
Spain	Oyambre	792	7,9	44

Oyambre beach:
Greater number of
pieces found

But less pieces per
meter

The Conclusion

When comparing the OSPAR 100m survey results for 2014 with the current survey results for Lake Geneva, the shores of Lake Geneva on average have more litter per meter than 63% of the other OSPAR regions.

To accurately assess the magnitude of the problem in freshwater environments and compare the results to marine environments the size of beach must be taken into account. For example, although the beach at Monte Velho (rank 37) has the same pieces/meter value as the Pierrier (rank 36) the survey total at Monte Velho is 49% greater than the Pierrier. Implying a smaller, more densely polluted shoreline at the Pierrier (figure 1).

The regions downstream of Switzerland are receiving water already loaded with litter that exceeds the average. The lack of data and complete absence of support for organizations inside of Switzerland to monitor the flow of marine litter into the EU from Switzerland clearly demonstrates the lack seriousness of Swiss authorities and NGOS in regards to marine litter mitigation.

Notes

The data cited for Switzerland only reflects a small area of the upper region of lake Geneva and is currently the only data available concerning the macro litter along the water ways of Switzerland, highlighting the need for more surveys following established protocols.

Comments and recommendations are welcome, please contact hammerdirt with your feedback.

This project is completely unfunded, the authors have dedicated their personal financial resources and time.

Individuals interested in financially supporting the expansion of this project in Switzerland, France, Germany or Italy should contact hammerdirt association.

This is an electronic document, if you have received a printed version you will not have access to the data and other resources included. Contact us we will email you the PDF.

About hammerdirt and the current project

The data presented for Switzerland is part of a long term monitoring project for the "Haut Lac" region of Lake Geneva. We would like to see this project spread to all the major lakes and water-ways of Switzerland.

Hammerdirt is a non-profit association. Created by Shannon and Roger Eismann in response to the [results of our first project](#) and complete lack of support or interest manifested by local, regional and national authorities.

Our goal is to use technology and leverage citizen participation to provide data today for the solutions of tomorrow.
